

iDSnet Express

An error free coding traceability solution

- Eliminates coding and labelling errors
- Increases coding and labelling efficiency
- Centralises product identification management
- Enables remote fault diagnosis
- Increases production visibility and machine status
- Managed through a server for ease of use

iDSnet Express is an integrated product traceability solution that is simple to use and easy to install.

What is iDSnet Express?

iDSnet Express integrates all of your coding and labelling equipment through a server or central PC. This is to deliver a product traceability solution throughout your business, creating a more streamlined, efficient and quality controlled operation.

How does iDSnet Express work?

By centralising control, iDSnet Express ensures that the correct code, such as barcode, datecode or batchcode, is always placed on the correct product at the correct time. By networking all coding and labelling devices back to a central database, product changes are effected down an entire production line with one simple operator action.

Eliminate coding errors

By controlling message selection from a central product database it avoids costly and time consuming errors. iDSnet Express ensures that the correct message is sent to all devices on the production line through the server.

Ease of use

iDSnet Express allows you to link numerous coders on a single or multiple packaging lines to one PC. This increases efficiency, reduces set-up time and eliminates coding errors.

Improve line performance

iDSnet Express helps improve line performance by:

- Providing centralised management of coding data
- Eliminating the need for data entry on the factory floor
- Providing a single point for set-up where multiple coding and labelling technologies are used
- Providing a common method of operation regardless of the type of coder used.

Remote fault diagnosis

Detailed log files and diagnostic information can be accessed remotely for increased troubleshooting efficiency and rapid response times.

iDSdesign

Designing labels and inkjet formats is all easily done within iDSnet Express. With a WYSIWYG display, you are able to create and edit messages for all compliant coding and labelling equipment from your PC.

Quick status indicators and notices

iDSnet Express provides clear and easy to see performance indicators on the PC. This includes highly visible status lights, alarms and error messages if any production line errors are detected. Automatic emails are sent for any upcoming service requirements to increase production line efficiencies and service response times.

Versatile and flexible

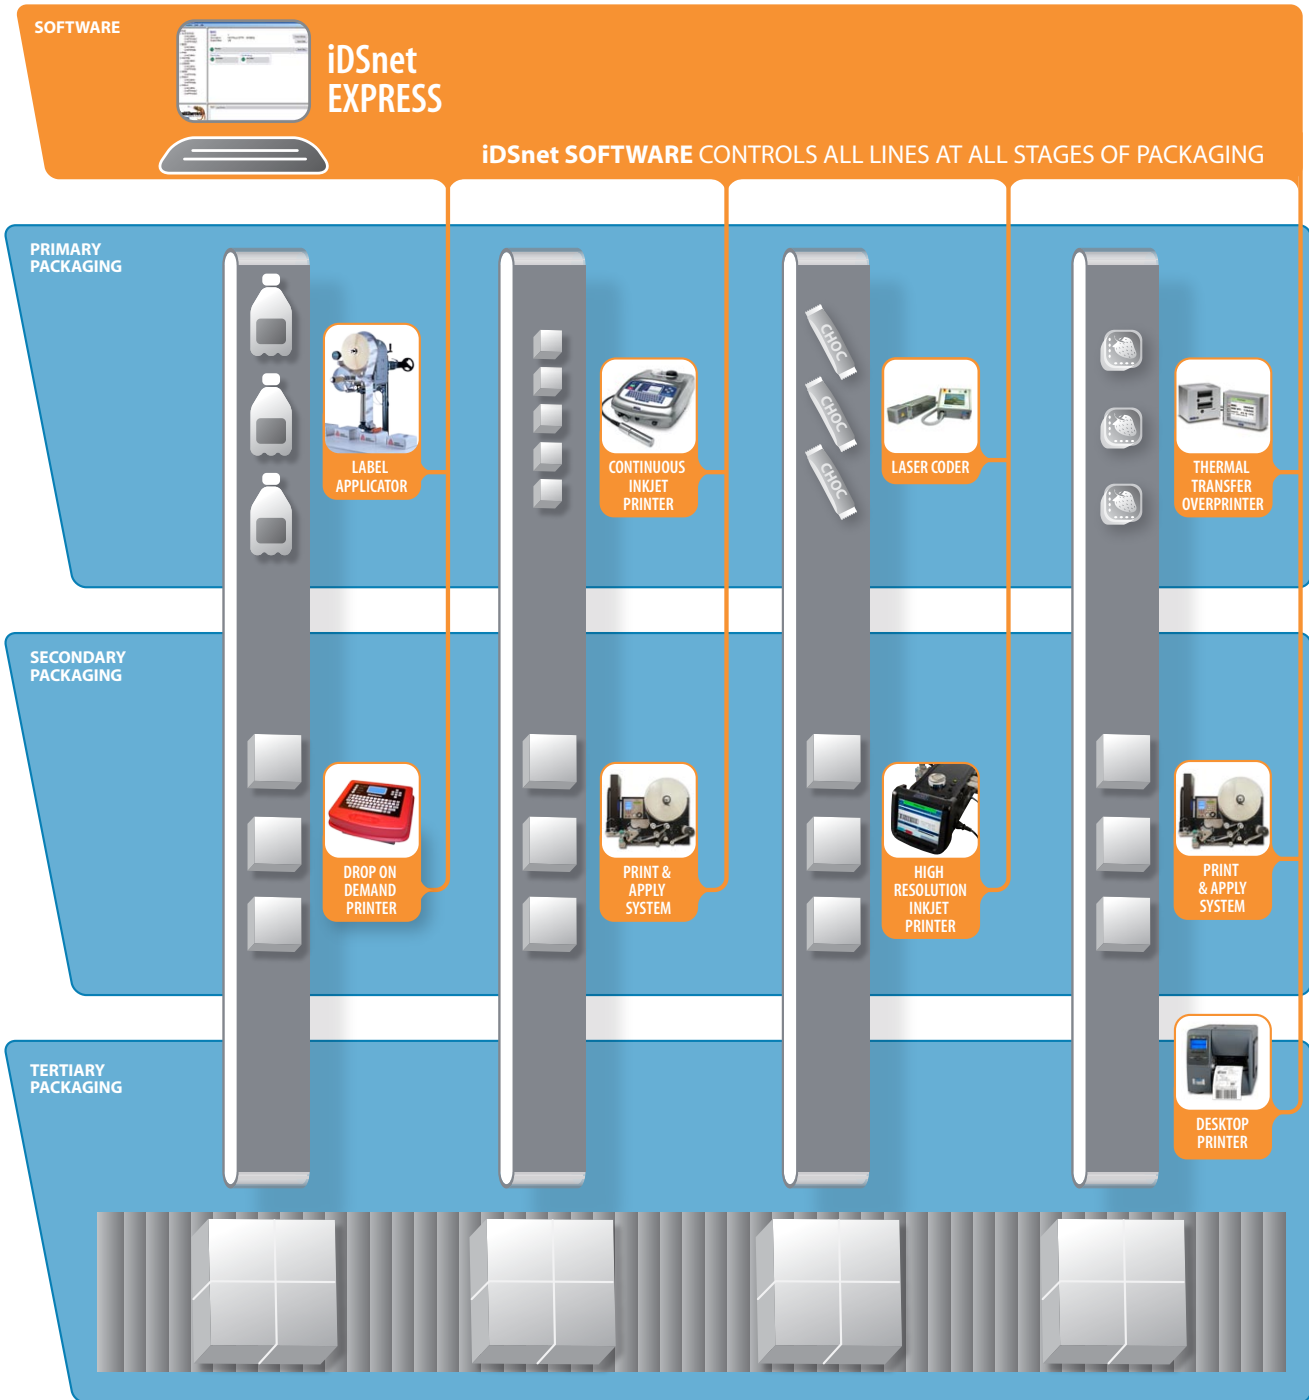

iDSnet Express integrates easily with compliant coders, desktop printers, labellers and other production line equipment. You can also upgrade to iDSnet Enterprise for more intricate network setups and integration options with your existing MRP, WMS, SCADA or ERP systems as well as our own iDSnet Manager web based reporting tool.

Local control

For increased control over the production line from the factory floor, iDSnet Express CIM (Communication Interface Module) is available as an optional extra.

iDSnet Express is able to control all compliant coding, labelling and traceability equipment on one or more production lines. No matter if you have label applicators, CIJ printers, laser coders, TTOs, DOD printers, high resolution inkjet printers or print and apply systems iDSnet Express provides easy, efficient and error free code management.
